Understanding API Compatibility: SAP, Workiva, Salesforce

What Does API-Compatible Mean?

API (Application Programming Interface) compatibility enables MBK's carbon credit tracking and MRV (Monitoring, Reporting, and Verification) system to integrate smoothly with other platforms via secure, machine-readable data exchange.

This capability allows enterprise users, especially those responsible for overseeing ESG disclosures, compliance, and financial reporting, to automatically synchronize carbon credit data with their existing systems.

System-Specific Benefits

SAP (Sustainability Control Tower / SAP ERP)

- Automates Scope 3 emissions accounting and procurement reporting
- Enables ESG dashboards to pull verifiable carbon data directly from MBK's blockchain-backed registry
- Used for audit-ready documentation in ESG audits, CSRD, and SEC climate risk filings

Workiva (ESG & Financial Reporting Platform)

- Syncs verified carbon credits and co-benefits into ESG reports
- Streamlines filing for SASB, TCFD, and SEC climate disclosures
- Enables internal control validation for ESG-related SOX compliance

Salesforce (Net Zero Cloud / CRM ESG extensions)

- Links verified carbon removals to customer-facing carbon neutrality claims
- Integrates credit purchases into Salesforce sustainability reporting dashboards

- Supports marketing and public ESG claims via traceable impact metrics
-

MBK's Advantage

MBK employs **IBM Hyperledger-based MRV** featuring batch-ID, timestamp, and geolocation tagging. This framework facilitates:

- Swift onboarding to enterprise systems
 - Decreased ESG reporting overhead
 - Fully verifiable credits that fulfill investor-grade climate assurance criteria
-

Conclusion

MBK's API-ready ecosystem facilitates easy ingestion of carbon credit data for buyers using SAP, Workiva, or Salesforce, thereby enhancing compliance, transparency, and marketability.
